# DÉCLARATION DE LIENS D'INTÉRÊT POTENTIELS

Intervenant : Nassima Amel TEBBAL , Alger

- Je n'ai pas de lien d'intérêt potentiel à déclarer

## Introduction :

- La coronarographie est l'examen de référence pour l'exploration de l'étendue et de la sévérité des lésions coronaires .
- Luminogramme limites en ce qui concerne l'évaluation de la paroi vasculaire, de la composition de la plaque et de l'étendue de l'athérosclérose
- Les techniques d'imagerie intracoronaire, notamment l'échographie intravasculaire (IVUS) et la tomographie par cohérence optique (OCT), peuvent surmonter certaines de ces limites de l'angiographie coronaire et réduire par la suite les événements cardiovasculaires indésirables .

# RENOVATE-COMPLEX-PCI: Intravascular imaging-guided versus angiography-guided procedural optimization in complex percutaneous coronary intervention

Reported from ACC 2022

Daniele Giacoppo report

Heart Vascular Stroke Institute  
in a Late-Breaking Trial  
New Orleans, LA, United States

Study population  
Patients  
• aged ≥19 years  
• undergoing PCI with contemporary drug-eluting stents or drug-coated balloons (only for in-stent restenosis)  
for significant coronary artery lesions

Where?

South Korea

Primary endpoint

9 sites

OCT-guided

Composite of death from cardiac causes, target vessel myocardial infarction or driven target vessel revascularisation at 1 year, which was powered for noninferiority margin, 3.1 percentage point difference, -0.6 percentage point upper boundary of the one-sided risk difference, 0.97; p<0.001 for noninferiority.

OCT group as compared with the IVUS group (noninferiority margin, 3.1 percentage point difference, -0.6 percentage point upper boundary of the one-sided risk difference, 0.97; p<0.001 for noninferiority).

## OCT vs. IVUS vs. angiography guidance #ESCCongress

A real-time updated network meta-analysis

### Conclusion

Intravascular imaging (IVI)-guided percutaneous coronary intervention (PCI) is associated with a lower rate of target lesion failure compared with angiography-guided PCI.

### Impact on clinical practice

These results emphasise the importance of physicians using IVI with either optical coherence tomography (OCT) or intravascular ultrasound (IVUS) to optimise stent outcomes and improve the long-term prognosis of their patients.

### Study objectives

This real-time updated network meta-analysis, integrating data from the **ILUMIEN IV** and **OCTOBER** trials with prior studies, examined the effects of IVI-guided PCI versus angiography-guided PCI.

### Who and what?

20 trials    12,428 patients randomised

IVI-guided PCI including:  
OCT    or    IVUS

angiography-guided PCI

follow-up  
between 6 months and 5 years

### Primary endpoint

Target lesion failure, defined as a composite of cardiac death, target vessel myocardial infarction, or target lesion revascularisation.

Reduced by 31% with vs.

### Secondary endpoints

Cardiac death reduced by 46% with vs.

Target vessel myocardial infarction reduced by 20% with vs.

Target lesion revascularisation reduced by 29% with vs.

Stent thrombosis reduced by 52% with vs.

Pour être inclus dans l'étude, les patients devaient présenter des **lésions coronaires complexes** définies par :

1. Lésion de vraie bifurcation (1/1,0,1/0,1,1) avec une side-branche  $\geq 2,5\text{mm}$
2. Occlusion totale chronique depuis  $> 3$  mois
3. Lésion d'un tronc commun non protégé
4. Lésion longue nécessitant l'implantation d'une longueur de stent  $> 38\text{ mm}$
5. Lésions sur  $> 2$  vaisseaux épicardiques majeurs traités au cours d'une seule procédure
6. Lésion nécessitant l'implantation de  $> 3$  stents
7. Lésion de resténose intra-stent
8. Lésions sévèrement calcifiées
9. Lésion ostiale de l'IVA, de la circonflexe ou de la coronaire droite.

## Recommendations on intravascular imaging for procedural optimization

Recommendations	Class <sup>a</sup>	Level <sup>b</sup>
IVUS or OCT should be considered in selected patients to optimize stent implantation. <sup>603,612,651–653</sup>	IIa	B
IVUS should be considered to optimize treatment of unprotected left main lesions. <sup>35</sup>	IIa	B

©ESC 2018

IVUS = intravascular ultrasound; OCT = optical coherence tomography.

<sup>a</sup>Class of recommendation.

<sup>b</sup>Level of evidence.

IVUS should be considered to assess the severity of unprotected left main lesions.<sup>35–37</sup>

IIa

B

## 2018 ESC/EACTS Guidelines on Myocardial Revascularisation

Intracoronary imaging should be considered to diagnose SCAD if suspected.

IIa

C

## 2020 ESC Guidelines for NSTEMI

COR	LOE	2021 ACC/AHA/SCAI Guideline for Coronary Artery Revascularization
2a	B-NR	1. In patients with intermediate stenosis of the left main artery, intravascular ultrasound (IVUS) is reasonable to help define lesion severity (1-5). *
2a	B-R	1. In patients undergoing coronary stent implantation, IVUS can be useful for procedural guidance, particularly in cases of left main or complex coronary artery stenting, to reduce ischemic events (1-10).
2a	B-R	2. In patients undergoing coronary stent implantation, OCT is a reasonable alternative to IVUS for procedural guidance, except in ostial left main disease (11-13).
2a	C-LD	3. In patients with stent failure, IVUS or OCT is reasonable to determine the mechanism of stent failure (14-17).

# Take Home Message :

- L'OCT et l'IVUS sont deux techniques utiles à l'arsenal du cardiologue interventionnel.
  - Problèmes logistiques, de disponibilité et de remboursement par l'Assurance.
  - Il n'est probablement pas nécessaire de l'utiliser dans chaque procédure, mais elles devraient potentiellement être utilisées dans la majorité des procédures.
- Quelques points restent à éclaircir :
- Le type de lésion cible Le timing d'utilisation
  - Le timing d'utilisation /La technique optimale
  - Les perspectives de prise en charge par la Sécurité Sociale.

Est-il temps de changer de pratique ?
