Need for echo standardization

Keynote Lecture Series

Systematic echocardiographic assessment of aortic regurgitation— what should the surgeon know for aortic valve repair?

Alain Berrebi, Jean-Luc Monin, Emmanuel Lansac

Department of Cardiac Pathology, Institut Mutualiste Montsouris, Paris, France

Email: alain.berrebi@imm.fr.

Aortic valve (AV) repair is the preferred surgical treatment in young patients with aortic regurgitation (AR) and/or proximal aorta aneurysm, as noted in the recent European Society of Cardiology (ESC) guidelines. However, this surgical option is still underused in clinical practice. This emphasizes the need to build a heart team dedicated to AV repair with expert surgeons and echocardiographers. Surgical techniques are now standardized in their approaches to enhance the reproducibility and expansion of AV repair. The objective of this keynote is to also demonstrate the need for a standardized pre-pump intra-operative echocardiography protocol to fulfill surgeon's needs in providing a road map and predicting techniques to be used for an effective and durable repair.

Ann Cardiothorac Surg 2019;8(3):331-341

2D/3D Echo and surgeon's needs

➤ 2D/3D Echo protocol

Mechanisms of AI Classification

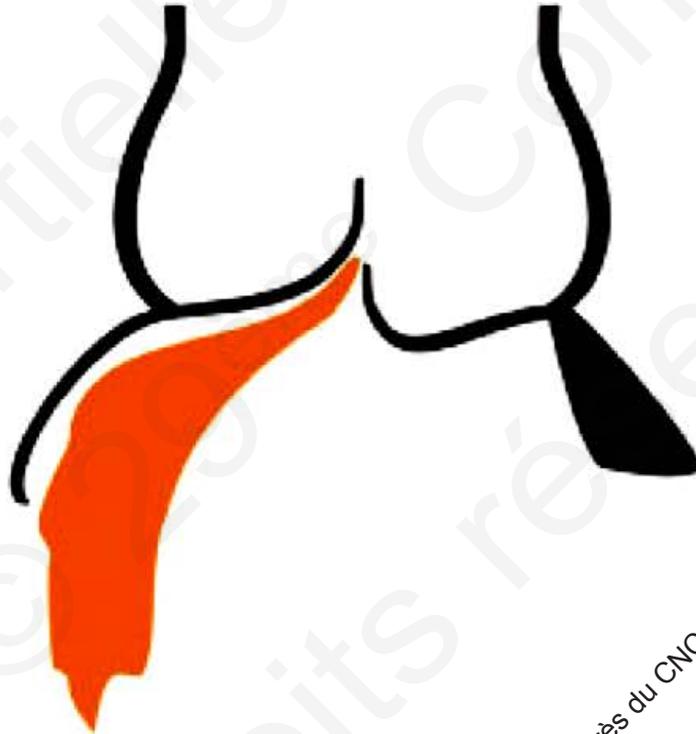

Type I

Normal cusp movements
related to aortic root
or ascending aorta dilation
with central jet

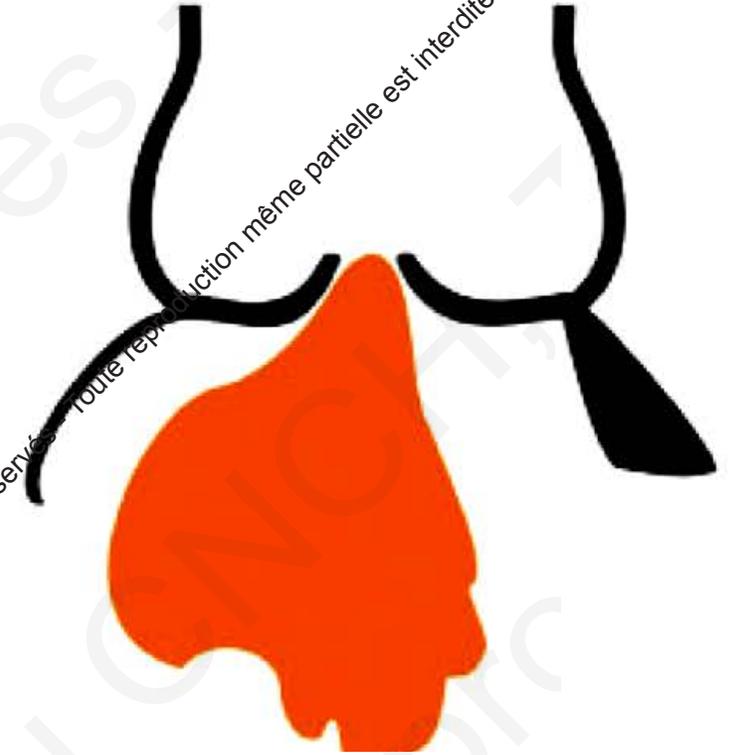

Type II

Cusp prolapse
with eccentric jet

Type III

Cusp retraction
with poor tissue quality or quantity
with large central
and/or eccentric jet

European Journal of Cardio-Thoracic Surgery 53 (2018) 1101-1107

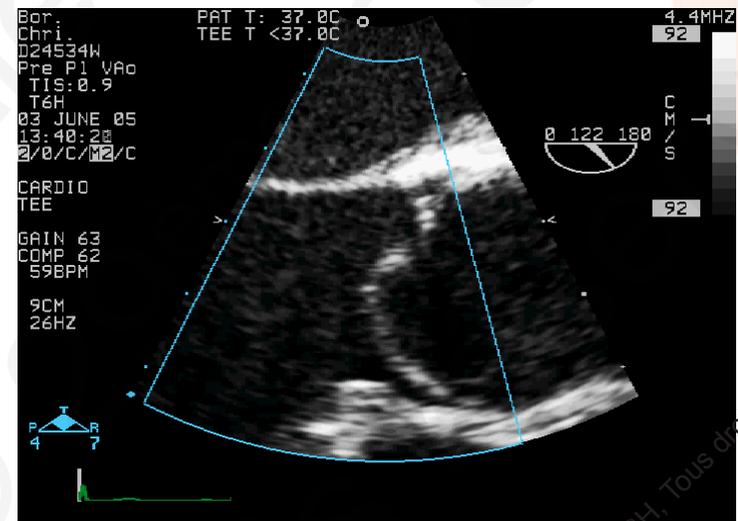

Cusp motion

Normal (I)

Excessive (II)

Restrictive (III)

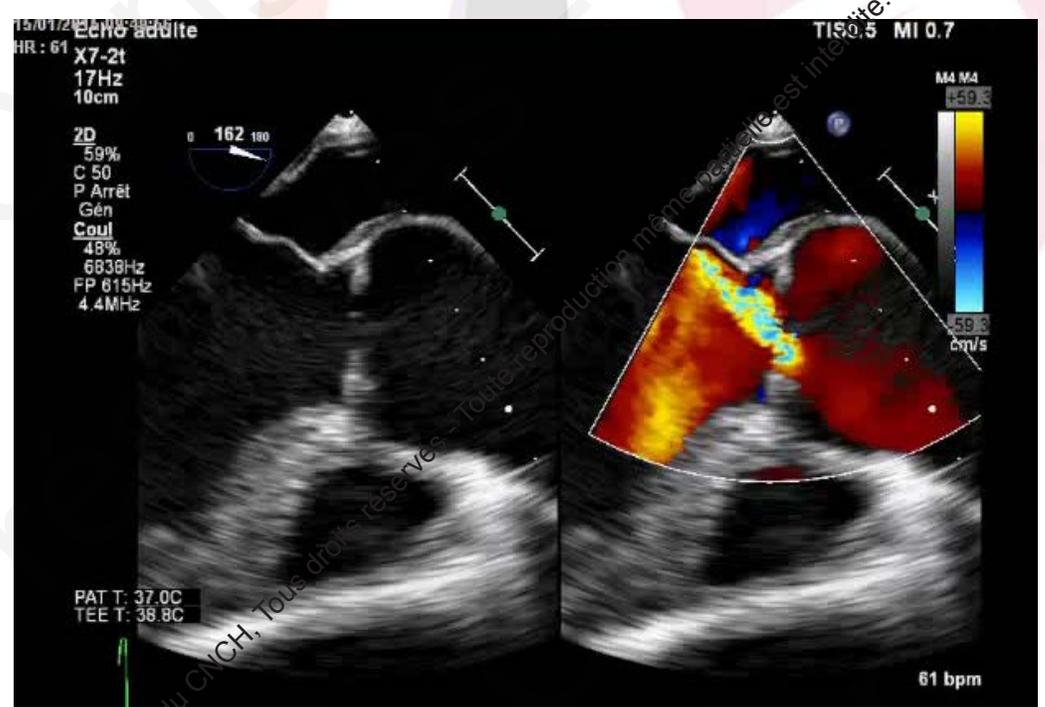

Cusp Prolapse: quantitative assessment with eH

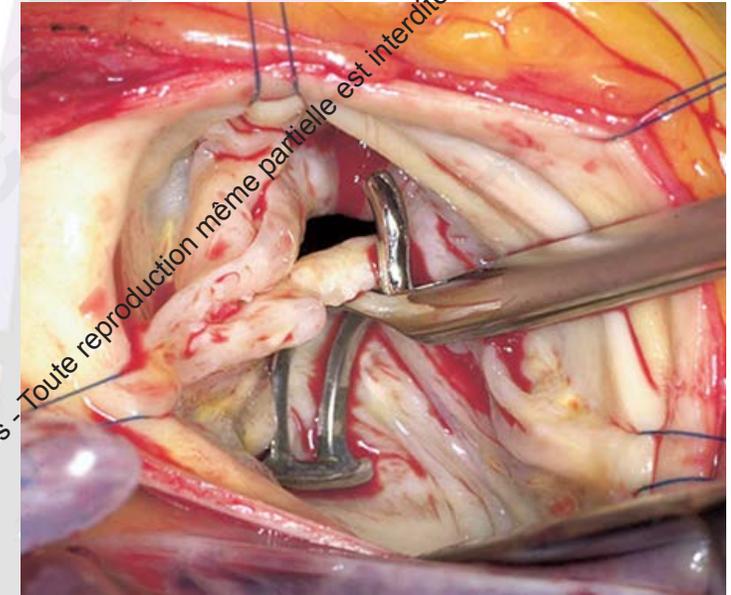

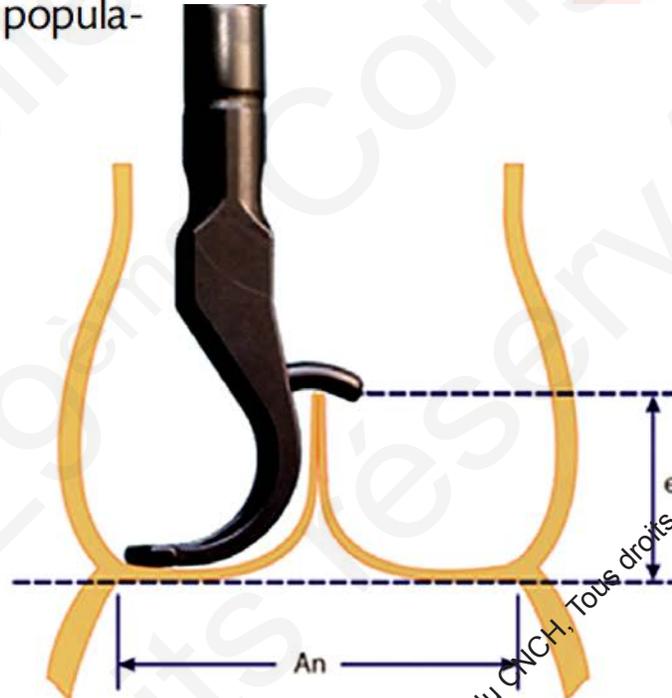

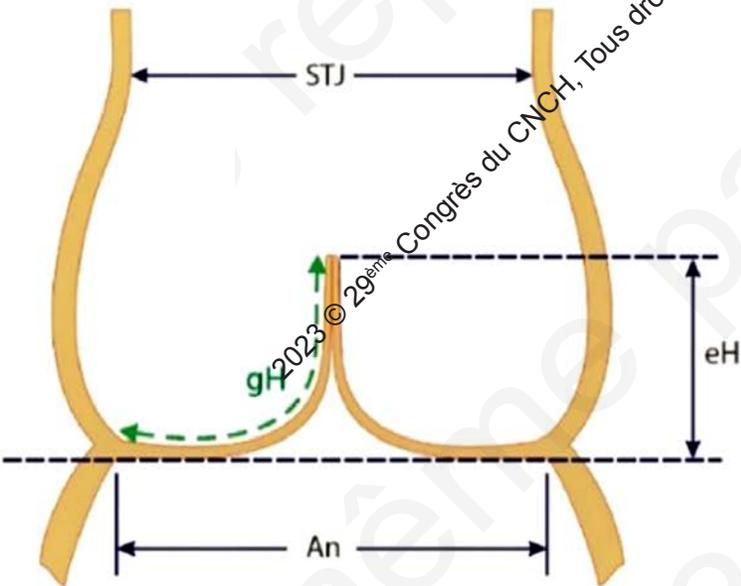

Complete (eH < 0)

Incomplete (eH < 9 mm)

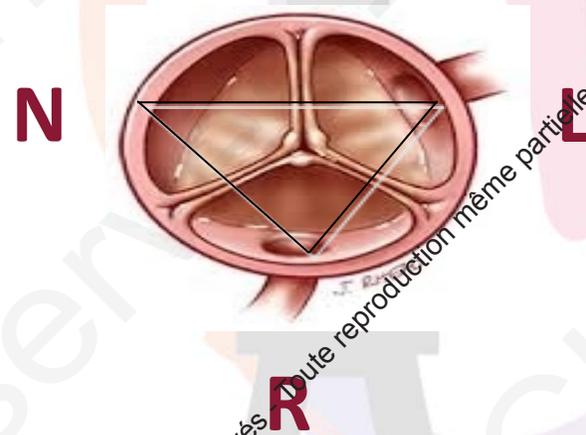

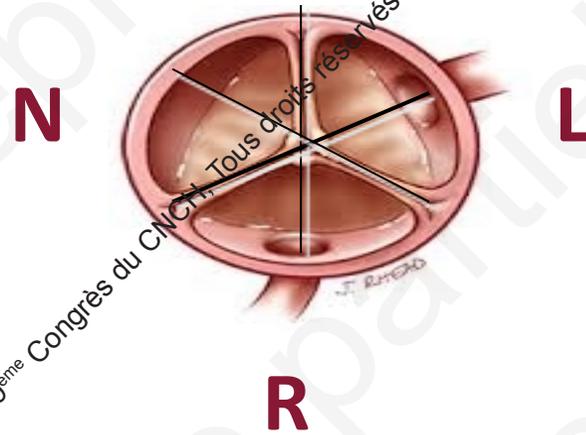

Dysfunction: Effective Height

The effective height (eH) is the orthogonal distance from the annulus to the middle of the free margin of the cusp. The eH can be measured by echocardiography and intraoperatively with a dedicated caliper. The normal eH in the adult population is close to 9 mm (8-10) [7].

Effective Height vs Coaptation length

Individual cusp

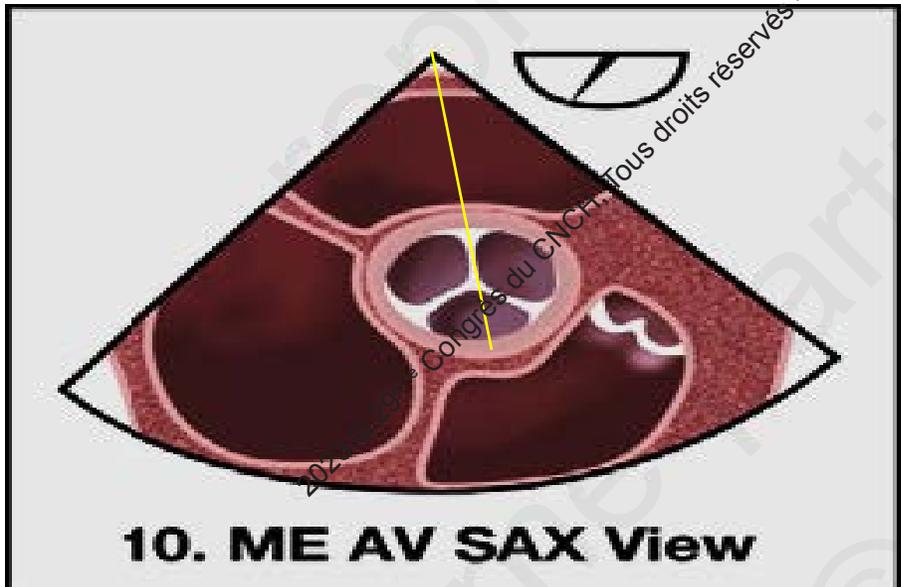

$\geq 9 \text{ mm}$

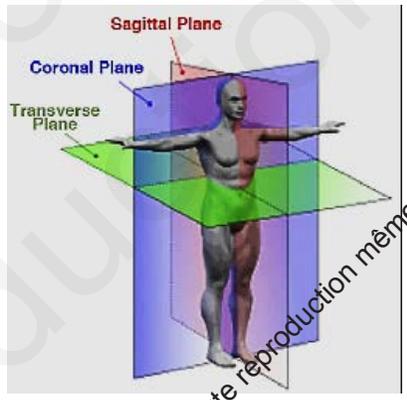

Two cusps

$\geq 5 \text{ mm}$

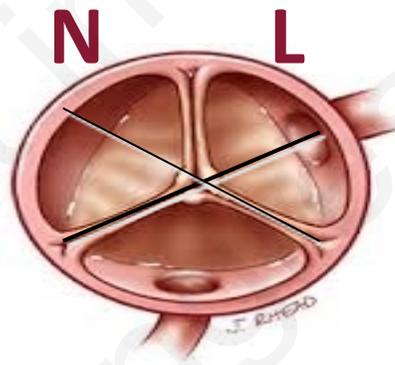

X Plane: only valid for eH of RCC

2D/3D Echo and surgeon's needs

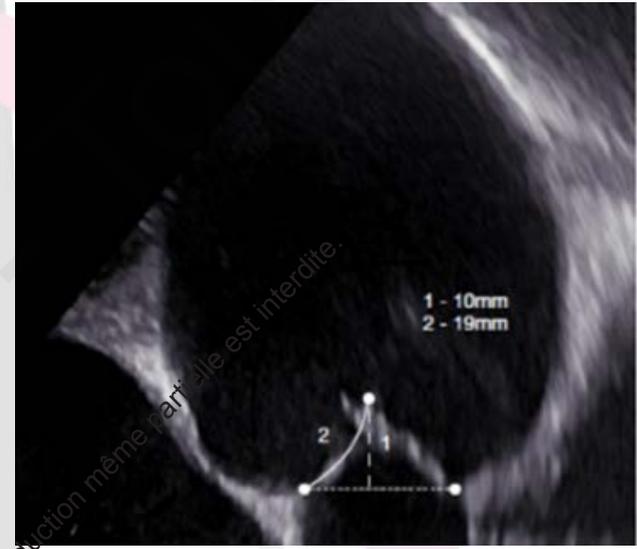

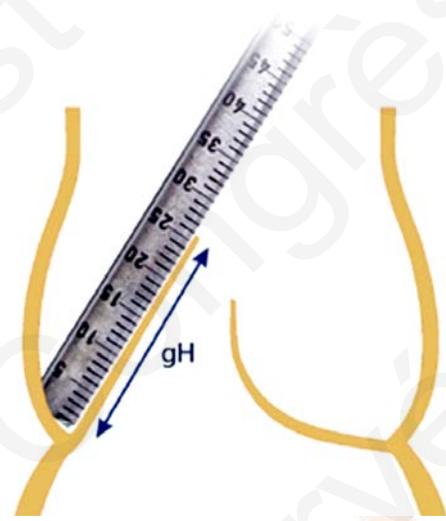

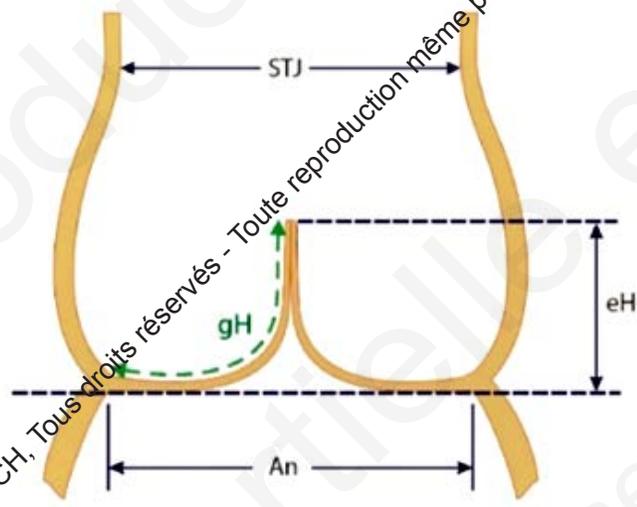

➤ 2D/3D Echo protocol

- basic views and measurements
- aorta phenotype
- etiology: tricuspid or bicuspid
- dysfunction
- lesion: amount and quality of tissue

➤ Impact on repair strategy

Lesion: Geometric Height (gH)

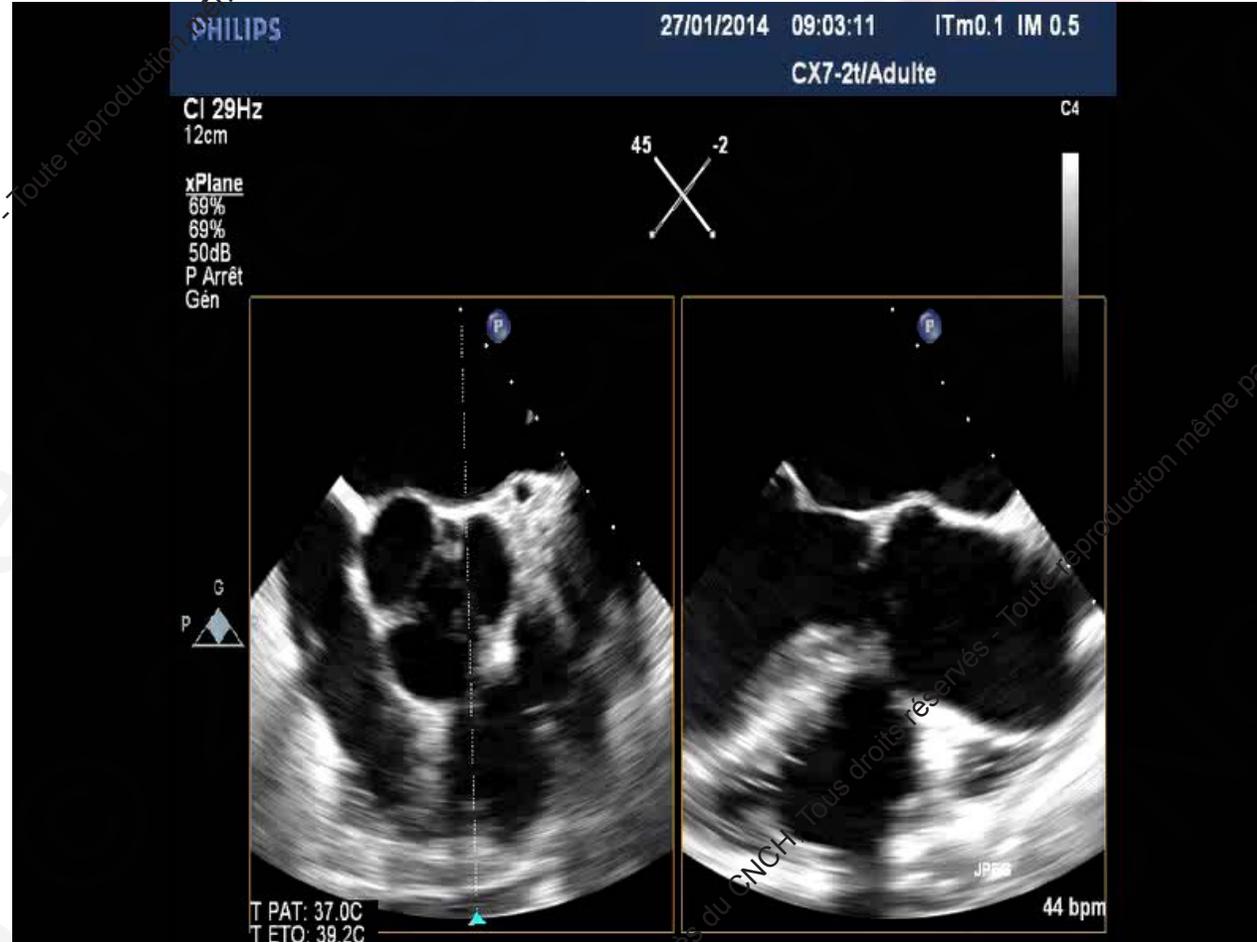

The geometric height (gH), also called the cusp height, is defined as the distance between the cusp nadir and the middle of the free margin. Intraoperatively, the gH is measured with a straight ruler along the aortic side of the cusp by applying gentle traction on the free margin to straighten the cusp tissue along the ruler. In adults, the cusp is considered retracted when the gH is 16 mm or less in TAVs and 19 mm or less in the bicuspid non-fused aortic cusp [8].

Lesion: amount and quality of tissue available

Restrictive motion with retraction*

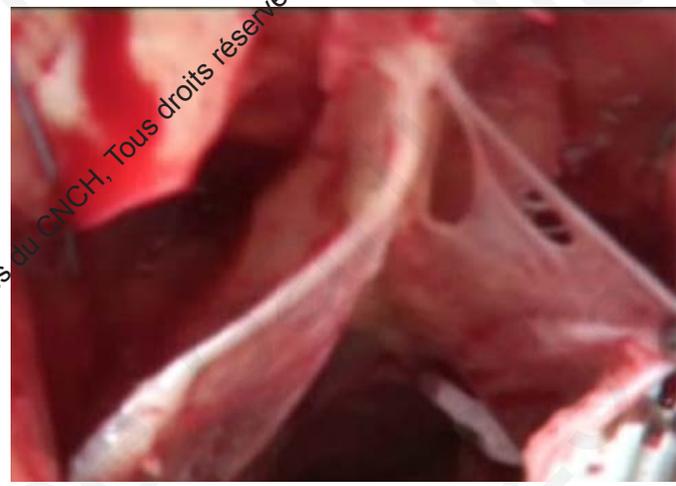

*retraction if geometric height: ≤ 16 mm (tricuspid) or ≤ 19 mm (bicuspid)

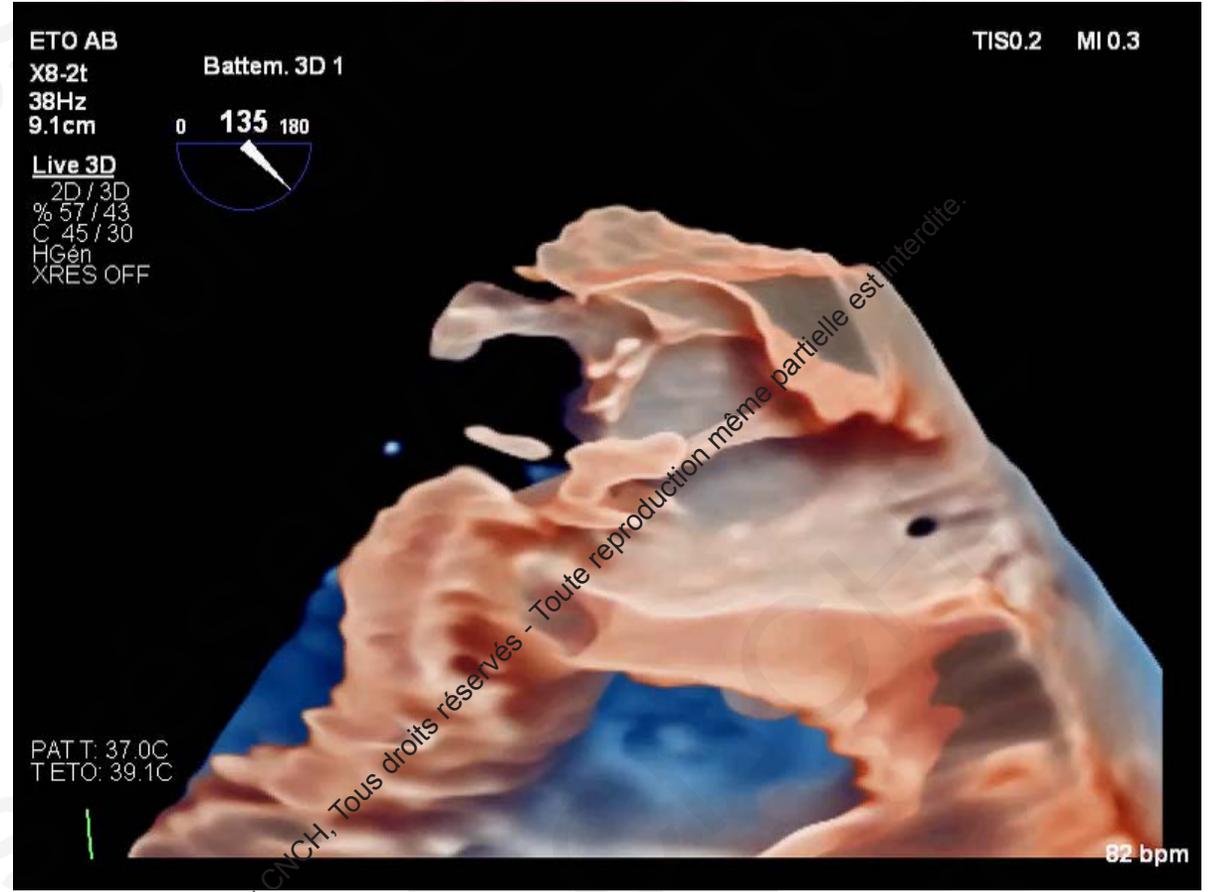

Fenestrations

**Congenital lesions
Para-commissural
coaptation zone**

**Pericardial patch if
« fragile » or ruptured**

Schäfers et al, JTCVS 2009

2D/3D Echo and surgeon's needs

➤ 2D/3D Echo protocol

- basic views and measurements
- aorta phenotype
- etiology: tricuspid or bicuspid
- dysfunction
- lesion: amount and quality of tissue

➤ Impact on repair strategy

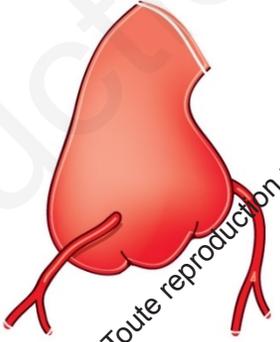

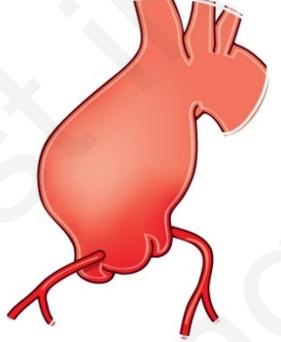

Impact in Aortic Valve Repair Strategy

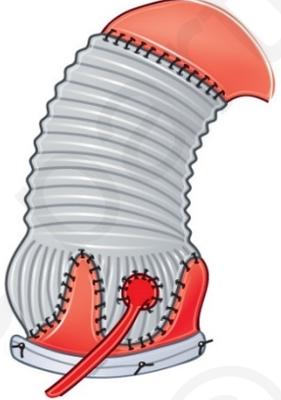

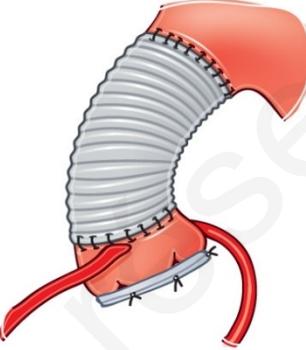

- **Individual cusp:**
 - **geometric height: retraction - repair or replace ?**
 ≤ 16 mm (tricuspid) or < 19 mm (bicuspid)
 - **effective Height (eH)**
 - **pre-op: < 9 mm: prolapse - resuspension**
 - **post-op: > 9 mm - durable result**
- **Two cusps:**
 - **coaptation length: > 5 mm - durable result**
 - **Commisural orientation (Bicuspid): $< 160^\circ$?**
 - **Fenestrations: number – fragility – repair with patch ?**

Phénotypes de l'aorte ascendante

 <p>Anévrisme de la racine aortique</p> <p>Valsalva \geq 45 mm</p>	 <p>Anévrisme sus-coronaire</p> <p>Valsalva $<$ 40 mm</p>	 <p>IA isolée</p> <p>Tous les \varnothing $<$ 40 mm</p>
---	---	--

Approche standardisée et physiologique de la plastie aortique

Reconstruction de la racine aortique		
 <p>Remodeling</p> <p>+ annuloplastie sous-valvulaire</p>	 <p>Tube sus-coronaire</p> <p>+ annuloplastie sous-valvulaire</p>	 <p>Annuloplastie sus-valvulaire</p> <p>+ annuloplastie sous-valvulaire</p>

Optimal candidates: all root phenotypes, bicuspid or tricuspid with any dysfunction but without retraction
